

Heritability follows what a definition catches, not how many cases it has

Liability-scale SNP heritability (up) against the number of cases (across, log scale), per definition

● first definition of the condition ● alternative definitions ○ estimate below zero, drawn at zero
 — bar: 50% interval ■ sleeve: 95% interval, cut at zero

READING THIS

Sleep apnoea: 0.125 from hospital records, 0.120 with primary care, 0.104 for any sleep disorder.
 Epilepsy: generalized 0.135 on 1,690 cases, focal 0.026 on 9,275; any epilepsy 0.055 sits between.
 Most cases, lower heritability: 3 of 6 conditions (epilepsy, sleep apnoea, constipation).
 Sample prevalence stands in for population prevalence, so compare heights within a condition.
