

For autism, no change of definition moves the genetics beyond chance

Shift in genetic correlation with iPSYCH-PGC autism against the first definition of each condition

READING THIS

Against each condition's first definition, 2 of 11 changes reach $p < 0.05$; 0 survive Bonferroni. Constipation moves by -0.010 where a shift of 0.21 was detectable: a well-powered null. Sleep apnoea could show a shift of 0.03 ; epilepsy needs 0.20 to 0.70 , which these data cannot resolve.
